

# Sodium clodronate for primary breast cancer

This booklet is about the drug sodium clodronate given to treat primary breast cancer. It explains what it is, who might be offered it and the side effects it can cause.

## **This information is by Breast Cancer Care.**

**We are the only specialist UK-wide charity that supports people affected by breast cancer. We've been supporting them, their family and friends and campaigning on their behalf since 1973.**

Today, we continue to offer reliable information and personal support, over the phone and online, from nurses and people who've been there. We also offer local support across the UK.

From the moment you notice something isn't right, through to treatment and beyond, we're here to help you feel more in control.

For breast cancer care, support and information, call us free on **0808 800 6000** or visit **[breastcancercare.org.uk](https://breastcancercare.org.uk)**

## What is sodium clodronate?

Sodium clodronate is a tablet that's given to reduce the risk of breast cancer spreading to the bones and other parts of the body.

It belongs to a group of drugs called bisphosphonates. These drugs slow down or prevent bone damage.

## Who might be offered sodium clodronate?

Sodium clodronate is suitable for women who have been through the menopause (post-menopausal women). It can be used regardless of whether the menopause happened naturally or because of breast cancer treatment.

You may be offered sodium clodronate if you are post-menopausal and have had treatment for invasive breast cancer that has spread to the lymph nodes under the arm.

It may also be considered if you have invasive breast cancer that has not spread to the lymph nodes.

You can read more about the lymph nodes in our booklet

**Understanding your pathology results.**

## Other uses

Sodium clodronate is also used to treat breast cancer that has spread to the bone.

The information in this booklet is for women who are taking it to reduce the risk of breast cancer spreading.

## How is it taken?

Sodium clodronate tablets are taken once a day.

You will usually be advised to take your tablets in the morning with a glass of water before eating.

You should not have anything to eat or drink (apart from water) for the next hour. You should not take any other tablets during this time.

You should also stay sitting or standing for one hour after taking them to avoid any irritation to the oesophagus (gullet).

## How long will I take sodium clodronate for?

You will usually be advised to take sodium clodronate for two to three years.

## What are the side effects of sodium clodronate?

Like any drug sodium clodronate can cause side effects. Everyone reacts differently to drugs and some people have more side effects than others.

This booklet does not list all the possible side effects. If you're taking other drugs while having sodium clodronate, you may also experience side effects from these and it's sometimes difficult to know which drug causes which side effects.

If you have any questions about side effects, whether they are listed here or not, talk to your treatment team.

## Common side effects

### Nausea (feeling sick) or vomiting (being sick)

This is usually mild. Anti-sickness drugs can be prescribed to relieve it.

### Diarrhoea

This is usually mild. Anti-diarrhoea medication can be prescribed to help control this. Contact your treatment team if you have four or more episodes of diarrhoea within 24 hours. Drink plenty of fluids to avoid getting dehydrated.

### Low calcium levels in the blood

Sodium clodronate can cause calcium levels in the blood to drop too low. This is called hypocalcaemia. You'll have regular blood tests to check the calcium levels. Early symptoms of low calcium levels include tingling around the mouth and lips and in the hands and feet. Let your treatment team know if you experience any of these. Your treatment team may recommend calcium and vitamin D supplements.

## Less common side effects

### Allergic reaction

Sodium clodronate can cause an allergic reaction. If you become breathless or start to develop an itchy rash let your doctor know straight away.

### Osteonecrosis

Sodium clodronate can cause some of the jaw bone to lose its blood supply and die. This is called osteonecrosis of the jaw (ONJ). It's an uncommon but serious side effect of sodium clodronate.

Symptoms include:

- lasting jaw pain
- loose teeth
- swelling, redness or ulcers on the gums

Let your treatment team and dentist know straight away if you have any of these symptoms.

ONJ is hard to treat so trying to prevent it is very important. Good dental hygiene can help reduce the risk of developing it. This includes brushing your teeth and flossing, making sure dentures fit well and having regular dental check-ups.

See your dentist for a check-up before starting treatment with sodium clodronate. Let them know you'll be taking sodium clodronate and speak to your treatment team if your dentist recommends any treatment before starting or while taking sodium clodronate.

In rare cases osteonecrosis can affect the ear. If you have any ear pain, discharge from your ear or an ear infection while taking sodium clodronate let your treatment team know.

## Fracture

Although it's rare, sodium clodronate can cause the femur (the large bone in the upper leg) to fracture. It's not fully understood why this happens and it's more common in people who have been taking sodium clodronate for a long time.

If you have lasting pain in your thigh, hip or groin, let your treatment team know.

## Effects on the kidneys

Sodium clodronate can affect the way the kidneys work. You may have blood tests to monitor this.

## Four ways to get support

We hope this information was helpful, but if you have questions, want to talk to someone or read more about breast cancer, here's how you can.

Speak to our nurses or trained experts. Call our free Helpline on **0808 800 6000** (Monday to Friday 9am–4pm and Saturday 9am–1pm). The Helpline can also put you in touch with someone who knows what it's like to have breast cancer.

Chat to other women who understand what you're going through in our friendly community, for support day and night. Look around, share, ask a question or support others at [forum.breastcancercare.org.uk](https://forum.breastcancercare.org.uk)

Find trusted information you might need to understand your situation and take control of your diagnosis or order information booklets at [breastcancercare.org.uk](https://breastcancercare.org.uk)

See what support we have in your local area. We'll give you the chance to find out more about treatments and side effects as well as meet other people like you. Visit [breastcancercare.org.uk/in-your-area](https://breastcancercare.org.uk/in-your-area)

# We're here for you: help us to be there for other people too

If you found this booklet helpful, please use this form to send us a donation. Our information resources and other services are only free because of support from people such as you.

Donate today and together we can ensure that everyone affected by breast cancer has someone to turn to.

Breast Cancer Care and Breast Cancer Now are uniting to create one charity for everyone affected by breast cancer. Our aim is that by 2050, everyone who develops breast cancer will live and be supported to live well.

From research to care, our new charity will have people affected by breast cancer at its heart – providing support for today and hope for the future. We'll find ways to prevent the disease, improve early diagnosis, develop new treatments, campaign for better care, and support people with the physical and emotional impact of breast cancer.
